Thermodynamics of Reactions  
Among Al<sub>2</sub>O<sub>3</sub>, CaO, SiO<sub>2</sub> and Fe<sub>2</sub>O<sub>3</sub>  
During Roasting Processes

Zhongping Zhu, Tao Jiang, Guanghui Li, Yufeng Guo and Yongbin Yang

China

1. Introduction

The thermodynamic of the chemical reactions among Al<sub>2</sub>O<sub>3</sub>, CaO, SiO<sub>2</sub> and Fe<sub>2</sub>O<sub>3</sub> in the roasting processes was investigated in this chapter. The chemical reactions are classified into SiO<sub>2</sub>-Al<sub>2</sub>O<sub>3</sub> system, Fe<sub>2</sub>O<sub>3</sub>-Al<sub>2</sub>O<sub>3</sub> system, SiO<sub>2</sub>-Fe<sub>2</sub>O<sub>3</sub> system, CaO-Al<sub>2</sub>O<sub>3</sub> system, SiO<sub>2</sub>-CaO system, SiO<sub>2</sub>-calcium aluminates system, CaO-Fe<sub>2</sub>O<sub>3</sub> system, Al<sub>2</sub>O<sub>3</sub>-calcium ferrites system and Al<sub>2</sub>O<sub>3</sub>-CaO-SiO<sub>2</sub>-Fe<sub>2</sub>O<sub>3</sub> system. When the roasting temperature is over 1100K, 3Al<sub>2</sub>O<sub>3</sub>·2SiO<sub>2</sub> is preferentially formed in SiO<sub>2</sub>-Al<sub>2</sub>O<sub>3</sub> system; FeO·Al<sub>2</sub>O<sub>3</sub> can be formed in Fe<sub>2</sub>O<sub>3</sub>-Al<sub>2</sub>O<sub>3</sub> system; ferric oxide and SiO<sub>2</sub> could not generate iron silicate; 12CaO·7Al<sub>2</sub>O<sub>3</sub> is preferentially formed in CaO-Al<sub>2</sub>O<sub>3</sub> system when one mole Al<sub>2</sub>O<sub>3</sub> reacts with CaO; 2CaO·SiO<sub>2</sub> is preferentially formed in SiO<sub>2</sub>-CaO system; except for CaO·2Al<sub>2</sub>O<sub>3</sub> and CaO·Al<sub>2</sub>O<sub>3</sub>, the other calcium aluminates can transform into calcium silicate by reacting with SiO<sub>2</sub> in SiO<sub>2</sub>-calcium aluminates system; 2CaO·Fe<sub>2</sub>O<sub>3</sub> is preferentially formed in CaO-Fe<sub>2</sub>O<sub>3</sub> system; alumina is unable to form 3CaO·Al<sub>2</sub>O<sub>3</sub> with calcium ferrites(2CaO·Fe<sub>2</sub>O<sub>3</sub> and CaO·Fe<sub>2</sub>O<sub>3</sub>), but able to form 12CaO·7Al<sub>2</sub>O<sub>3</sub> with 2CaO·Fe<sub>2</sub>O<sub>3</sub>; when CaO, Fe<sub>2</sub>O<sub>3</sub>, Al<sub>2</sub>O<sub>3</sub>, SiO<sub>2</sub> coexist, they are more likely to form ternary compound 2CaO·Al<sub>2</sub>O<sub>3</sub>·SiO<sub>2</sub> and 4CaO·Al<sub>2</sub>O<sub>3</sub>·Fe<sub>2</sub>O<sub>3</sub>.

2. Binary compounds

2.1 Fe<sub>2</sub>O<sub>3</sub>-Al<sub>2</sub>O<sub>3</sub>-CaCO<sub>3</sub> system

Fe<sub>2</sub>O<sub>3</sub> and Al<sub>2</sub>O<sub>3</sub> can all react with limestone during roasting to generate corresponding aluminates and ferrites. In Fe<sub>2</sub>O<sub>3</sub>-Al<sub>2</sub>O<sub>3</sub>-CaO system, the reaction Fe<sub>2</sub>O<sub>3</sub> and Al<sub>2</sub>O<sub>3</sub> with CaCO<sub>3</sub> coexist, and the reactions equations are as followed:

| Reactions  | A, J/mol | B, J/K.mol | Temperature, K |
|--|----------|------------|----------------|
| CaCO <sub>3</sub> +Al <sub>2</sub> O <sub>3</sub> =CaO·Al <sub>2</sub> O <sub>3</sub> +CO <sub>2</sub> | 161088.3 | -244.1     | 298~1200       |
| CaCO <sub>3</sub> +Fe <sub>2</sub> O <sub>3</sub> =CaO·Fe <sub>2</sub> O <sub>3</sub> +CO <sub>2</sub> | 151677.8 | -220.9     | 298~1200       |

Table 1. The  $\Delta G_T^\theta$  of Fe<sub>2</sub>O<sub>3</sub>-Al<sub>2</sub>O<sub>3</sub>-CaCO<sub>3</sub> system ( $\Delta G_T^\theta = A + BT$ , J/mol;  $P_{CO_2}$  =30Pa, i.e., the partial pressure of CO<sub>2</sub> in the air)

The relationships between Gibbs free energy ( $\Delta G_T^\theta$ ) and temperature (T) are as shown in figure 1.

Fig. 1. Relationships between  $\Delta G_T^\theta$  and temperature in  $\text{Fe}_2\text{O}_3\text{-Al}_2\text{O}_3\text{-CaCO}_3$  system

Figure 1 shows that, the Gibbs free energy of reactions on  $\text{Fe}_2\text{O}_3$  and  $\text{Al}_2\text{O}_3$  with  $\text{CaCO}_3$  decreased with the rise of temperature in normal roasting process (due to decomposition of  $\text{CaCO}_3$  over 1200K, so the curve has no drawing above 1200K), and the reactions all can automatically react to generate the corresponding calcium aluminate and calcium ferrite. The  $\Delta G_T^\theta$  of reaction with  $\text{Al}_2\text{O}_3$  is more negative than the  $\Delta G_T^\theta$  of reaction with  $\text{Fe}_2\text{O}_3$  at the same temperature.  $\text{CaCO}_3$  has actually decomposed at 1473~1673K industrial roasting temperature, therefore, only CaO is taken into account on the following analysis.

2.2  $\text{SiO}_2\text{-Al}_2\text{O}_3$  system

$\text{SiO}_2$  mainly comes from the ore and coke ash in the roasting process.  $\text{SiO}_2$  reacts with  $\text{Al}_2\text{O}_3$  to form aluminium silicates. The aluminium silicates mainly include  $\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$  ( $\text{AS}_2$ ),  $\text{Al}_2\text{O}_3 \cdot \text{SiO}_2$  ( $\text{AS}$ ,andalusite),  $\text{AS}$ (kyanite),  $\text{AS}$ (fibrolite),  $3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$  ( $\text{A}_3\text{S}_2$ ). Thermodynamic calculation indicates that,  $\text{AS}_2$  can not be formed from the reaction of  $\text{Al}_2\text{O}_3$  and  $\text{SiO}_2$  under the roasting condition. The others equations are shown in table 2.

| Reactions   | A, J/mol | B, J/K.mol | Temperature, K |
|---|----------|------------|----------------|
| $\text{Al}_2\text{O}_3 + \text{SiO}_2 = \text{Al}_2\text{O}_3 \cdot \text{SiO}_2$ ( kyanite )               | -8469.3  | 9.0        | 298~1696       |
| $\text{Al}_2\text{O}_3 + \text{SiO}_2 = \text{Al}_2\text{O}_3 \cdot \text{SiO}_2$ ( fibrolite )             | -4463.8  | -0.9       | 298~1696       |
| $\text{Al}_2\text{O}_3 + \text{SiO}_2 = \text{Al}_2\text{O}_3 \cdot \text{SiO}_2$ ( andalusite )            | -6786.1  | 0.6        | 298~1696       |
| $\frac{3}{2}\text{Al}_2\text{O}_3 + \text{SiO}_2 = (\frac{1}{2})3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$ | 12764.7  | -16.7      | 298~1696       |

Table 2. The  $\Delta G_T^\theta$  of  $\text{Al}_2\text{O}_3\text{-SiO}_2$  system (  $\Delta G_T^\theta = A + BT$  , J/mol)

The relationships of  $\Delta G_T^\theta$  and temperature in  $\text{Al}_2\text{O}_3\text{-SiO}_2$  system is shown in figure 2.

Fig. 2. Relationships of  $\Delta G_T^\theta$  and temperature in Al<sub>2</sub>O<sub>3</sub>-SiO<sub>2</sub> system

Figure 2 shows that, the  $\Delta G_T^\theta$  of kyanite is greater than zero at 1000~1700K, so the reaction cannot happen; the  $\Delta G_T^\theta$  of andalusite and fibrolite alter little with temperature changes; the  $\Delta G_T^\theta$  of A<sub>3</sub>S<sub>2</sub> decreases with the rise of temperature. The thermodynamic order of forming aluminium silicates is A<sub>3</sub>S<sub>2</sub>, AS(andalusite), AS(fibrolite) at 1100~1700K.

**2.3 Fe<sub>2</sub>O<sub>3</sub>-Al<sub>2</sub>O<sub>3</sub> system**

Al<sub>2</sub>O<sub>3</sub> does not directly react with Fe<sub>2</sub>O<sub>3</sub>, but Al<sub>2</sub>O<sub>3</sub> may react with wustite (FeO) produced during roasting process to form FeO·Al<sub>2</sub>O<sub>3</sub>. No pure ferrous oxide (FeO) exists in the actual process. The ratio of oxygen atoms to iron atoms is more than one in wustite, which is generally expressed as Fe<sub>x</sub>O (x=0.83~0.95), whose crystal structure is absence type crystallography. For convenience, FeO is expressed as wustite in this thesis. Al<sub>2</sub>O<sub>3</sub> may react with wustite(FeO) to form FeO·Al<sub>2</sub>O<sub>3</sub> in the roasting process. The relationship of  $\Delta G_T^\theta$  and temperature is shown in figure 2, and the chemical reaction of the equation is as followed:

Fig. 3. Relationship of  $\Delta G_T^\theta$  and temperature in Fe<sub>2</sub>O<sub>3</sub>-Al<sub>2</sub>O<sub>3</sub> system

Figure 3 shows that, the  $\Delta G_T^\theta$  is negative at 843~1650K, reaction can happen and generate  $\text{FeO} \cdot \text{Al}_2\text{O}_3$ ; the  $\Delta G_T^\theta$  rises with the temperature, the higher temperature is, the lower thermodynamic reaction trends.

2.4  $\text{SiO}_2\text{-Fe}_2\text{O}_3$  system

$\text{SiO}_2$  also does not directly react with  $\text{Fe}_2\text{O}_3$ , but  $\text{Al}_2\text{O}_3$  may react with wustite ( $\text{FeO}$ ) to form  $\text{FeO} \cdot \text{SiO}_2$  (FS) and  $2\text{FeO} \cdot \text{SiO}_2(\text{F}_2\text{S})$ . The relationships of  $\Delta G_T^\theta$  and temperature is shown in figure 4, and the chemical reactions of the equations are shown in table 3.

| Reactions   | A, J/mol | B, J/K.mol | Temperature, K |
|---|----------|------------|----------------|
| $\text{FeO} + \text{SiO}_2 = \text{FeO} \cdot \text{SiO}_2$   | 26524.6  | 18.8       | 847~1413       |
| $2\text{FeO} + \text{SiO}_2 = 2\text{FeO} \cdot \text{SiO}_2$ | -13457.3 | 30.3       | 847~1493       |

Table 3. The  $\Delta G_T^\theta$  of  $\text{SiO}_2\text{-Al}_2\text{O}_3$  system ( $\Delta G_T^\theta = A + BT$ , J/mol)

Figure 4 shows that, the  $\Delta G_T^\theta$  of  $\text{SiO}_2\text{-Al}_2\text{O}_3$  system are above zero at 847~1500K, so all of the reactions can not happen to form ferrous silicates (FS and  $\text{F}_2\text{S}$ ).

Fig. 4. Relationships of  $\Delta G_T^\theta$  and temperature in  $\text{SiO}_2\text{-Fe}_2\text{O}_3$  system

2.5  $\text{CaO-Al}_2\text{O}_3$  system

$\text{Al}_2\text{O}_3$  can react with  $\text{CaO}$  to form calcium aluminates such as  $3\text{CaO} \cdot \text{Al}_2\text{O}_3(\text{C}_3\text{A})$ ,  $12\text{CaO} \cdot 7\text{Al}_2\text{O}_3(\text{C}_{12}\text{A}_7)$ ,  $\text{CaO} \cdot \text{Al}_2\text{O}_3(\text{CA})$  and  $\text{CaO} \cdot 2\text{Al}_2\text{O}_3(\text{CA}_2)$ . As regard as the calcium aluminates only  $\text{C}_{12}\text{A}_7$  can be totally soluble in soda solution,  $\text{C}_3\text{A}$  and  $\text{CA}$  dissolve with a slow speed, and the other calcium aluminates such as  $\text{CA}_2$  are completely insoluble. Equations that  $\text{Al}_2\text{O}_3$  reacted with  $\text{CaO}$  to form  $\text{C}_3\text{A}$ ,  $\text{C}_{12}\text{A}_7$ ,  $\text{CA}$  and  $\text{CA}_2$  are presented in table 4.

Figure 5 shows that, the  $\Delta G_T^\theta$  of reactions of  $\text{Al}_2\text{O}_3$  with  $\text{CaO}$  decreases with the rise of temperature; all reactions automatically proceed to generate the corresponding calcium aluminates at normal roasting temperature (1473~1673K, same as follows); At the same

roasting temperature, the thermodynamic order that one mole Al<sub>2</sub>O<sub>3</sub> reacts with CaO to generate calcium aluminates such as C<sub>12</sub>A<sub>7</sub>, C<sub>3</sub>A, CA, CA<sub>2</sub>.

| Reactions   | A, J/mol | B, J/K.mol | Temperature, K |
|---|----------|------------|----------------|
| 3CaO+ Al <sub>2</sub> O <sub>3</sub> =3CaO·Al <sub>2</sub> O <sub>3</sub>                                 | -9.9     | -28.4      | 298~1808       |
| $\frac{12}{7}$ CaO+Al <sub>2</sub> O <sub>3</sub> =( $\frac{1}{7}$ )12CaO·7Al <sub>2</sub> O <sub>3</sub> | 318.3    | -44.5      | 298~1800       |
| CaO+ Al <sub>2</sub> O <sub>3</sub> =CaO·Al <sub>2</sub> O <sub>3</sub>                                   | -15871.5 | -18.1      | 298~1878       |
| $\frac{1}{2}$ CaO+Al <sub>2</sub> O <sub>3</sub> =( $\frac{1}{2}$ )CaO·2Al <sub>2</sub> O <sub>3</sub>    | -6667.2  | -13.8      | 298~2023       |

Table 4. The  $\Delta G_T^\theta$  of Al<sub>2</sub>O<sub>3</sub>-CaO system ( $\Delta G_T^\theta = A + BT$ , J/mol)

The relationships between  $\Delta G_T^\theta$  and temperature (T) are shown in figure 5.

Fig. 5. Relationships between  $\Delta G_T^\theta$  and temperature in Al<sub>2</sub>O<sub>3</sub>-CaO system

| Reactions  | A, J/mol | B, J/K.mol | Temperature, K |
|--|----------|------------|----------------|
| $(\frac{4}{3})3\text{CaO} \cdot \text{Al}_2\text{O}_3 + \text{Al}_2\text{O}_3 = (\frac{1}{3})12\text{CaO} \cdot 7\text{Al}_2\text{O}_3$    | 13939.7  | -65.8      | 298~1800       |
| $(\frac{1}{2})3\text{CaO} \cdot \text{Al}_2\text{O}_3 + \text{Al}_2\text{O}_3 = (\frac{3}{2})\text{CaO} \cdot \text{Al}_2\text{O}_3$       | -18843.8 | -13.0      | 298~1878       |
| $(\frac{1}{5})3\text{CaO} \cdot \text{Al}_2\text{O}_3 + \text{Al}_2\text{O}_3 = (\frac{3}{5})\text{CaO} \cdot 2\text{Al}_2\text{O}_3$      | -6011.2  | -10.9      | 298~2023       |
| $(\frac{1}{5})12\text{CaO} \cdot 7\text{Al}_2\text{O}_3 + \text{Al}_2\text{O}_3 = (\frac{12}{5})\text{CaO} \cdot \text{Al}_2\text{O}_3$    | -38544.8 | 18.8       | 298~1878       |
| $(\frac{1}{17})12\text{CaO} \cdot 7\text{Al}_2\text{O}_3 + \text{Al}_2\text{O}_3 = (\frac{12}{17})\text{CaO} \cdot 2\text{Al}_2\text{O}_3$ | -9541.1  | -1.2       | 298~2023       |
| CaO · Al <sub>2</sub> O <sub>3</sub> + Al <sub>2</sub> O <sub>3</sub> =CaO · 2Al <sub>2</sub> O <sub>3</sub>                               | 2543.8   | -9.5       | 298~2023       |

Table 5. The  $\Delta G_T^\theta$  of Al<sub>2</sub>O<sub>3</sub>-calcium aluminates system ( $\Delta G_T^\theta = A + BT$ , J/mol)

When CaO is insufficient, redundant Al<sub>2</sub>O<sub>3</sub> may promote the newly generated high calcium-to-aluminum ratio (CaO to Al<sub>2</sub>O<sub>3</sub> mole ratio) calcium aluminates to transform into lower calcium-to-aluminum ratio calcium aluminates. The reactions of the equations are presented in table 5:

The relationships between  $\Delta G_T^\theta$  of reactions of Al<sub>2</sub>O<sub>3</sub>-calcium aluminates system and temperature (T) are shown in figure 6.

Fig. 6. Relationships between  $\Delta G_T^\theta$  of reactions Al<sub>2</sub>O<sub>3</sub>-calcium aluminates system and temperature

Figure 6 shows that, Gibbs free energy of the reaction of Al<sub>2</sub>O<sub>3</sub>-calcium aluminates system are negative at 400~1700K, and all the reactions automatically proceed to generate the corresponding low calcium-to-aluminum ratio calcium aluminates; Except for the reaction of Al<sub>2</sub>O<sub>3</sub>-C<sub>12</sub>A<sub>7</sub>, the  $\Delta G_T^\theta$  of the rest reactions decreases with the rise of temperature and becomes more negative. Comparing figure 4 with figure 5, it can be found that Al<sub>2</sub>O<sub>3</sub> reacts with CaO easily to generate C<sub>12</sub>A<sub>7</sub>.

2.6 SiO<sub>2</sub>- CaO system

SiO<sub>2</sub> can react with CaO to form CaO·SiO<sub>2</sub> (CS), 3CaO·2SiO<sub>2</sub> (C<sub>3</sub>S<sub>2</sub>), 2CaO·SiO<sub>2</sub> (C<sub>2</sub>S) and 3CaO·SiO<sub>2</sub>(C<sub>3</sub>S) in roasting process. The reactions are shown in table 6, and the relationships between  $\Delta G^0$  of the reactions of SiO<sub>2</sub> with CaO and temperature are shown in figure 7.

| Reactions  | A, J/mol  | B, J/K.mol | Temperature, K |
|--|-----------|------------|----------------|
| CaO+SiO <sub>2</sub> = CaO·SiO <sub>2</sub> (pseud-wollastonite)             | -83453.0  | -3.4       | 298~1817       |
| CaO+SiO <sub>2</sub> = CaO·SiO <sub>2</sub> (wollastonite)                   | -89822.9  | -0.3       | 298~1817       |
| $\frac{3}{2}$ CaO+SiO <sub>2</sub> =( $\frac{1}{2}$ ) 3CaO·2SiO <sub>2</sub> | -108146.6 | -3.1       | 298~1700       |
| 3CaO+SiO <sub>2</sub> = 3CaO·SiO <sub>2</sub>                                | -111011.9 | -11.3      | 298~1800       |
| 2CaO+SiO <sub>2</sub> = 2CaO·SiO <sub>2</sub> (β)                            | -125875.1 | -6.7       | 298~2403       |
| 2CaO+SiO <sub>2</sub> = 2CaO·SiO <sub>2</sub> (γ)                            | -137890.1 | 3.7        | 298~1100       |

Table 6. The  $\Delta G_T^\theta$  of SiO<sub>2</sub>-CaO system(  $\Delta G_T^\theta = A + BT$  , J/mol)

Fig. 7. Relationships between  $\Delta G_T^\theta$  and temperature

Figure 7 shows that,  $\text{SiO}_2$  reacts with  $\text{CaO}$  to form  $\gamma\text{-C}_2\text{S}$  when temperature below 1100K, but  $\beta\text{-C}_2\text{S}$  comes into being when the temperature above 1100K. At normal roasting temperature, the thermodynamic order of forming calcium silicate is  $\text{C}_2\text{S}$ ,  $\text{C}_3\text{S}$ ,  $\text{C}_3\text{S}_2$ ,  $\text{CS}$ .

Figure 5 ~ figure 7 show that,  $\text{CaO}$  reacts with  $\text{SiO}_2$  and  $\text{Al}_2\text{O}_3$  firstly to form  $\text{C}_2\text{S}$ , and then  $\text{C}_{12}\text{A}_7$ . Therefore, it is less likely to form aluminium silicates in roasting process.

## 2.7 $\text{SiO}_2$ - calcium aluminates system

In the  $\text{CaO}\text{-Al}_2\text{O}_3$  system, if there exists some  $\text{SiO}_2$ , the newly formed calcium aluminates are likely to react with  $\text{SiO}_2$  to transform to calcium silicates and  $\text{Al}_2\text{O}_3$  because  $\text{SiO}_2$  is more acidity than that of  $\text{Al}_2\text{O}_3$ . The reaction equations are presented in table 7, the relationships between  $\Delta G_T^\theta$  and temperature are shown in figure 8.

Figure 8 shows that, the  $\Delta G_T^\theta$  of all the reactions increases with the temperature increases; the reaction  $(3\text{CA}_2 + \text{SiO}_2 = \text{C}_3\text{S} + 6\text{Al}_2\text{O}_3)$  can not happen when the roasting temperature is above 900K, i.e., the lowest calcium-to-aluminum ratio calcium aluminates cannot transform to the highest calcium-to-silicon ratio ( $\text{CaO}$  to  $\text{SiO}_2$  molecular ratio) calcium silicate; when the temperature is above 1500K, the  $\Delta G_T^\theta$  of reaction  $(3\text{CA} + \text{SiO}_2 = \text{C}_3\text{S} + 3\text{Al}_2\text{O}_3)$  is also more than zero; but the other calcium aluminates all can react with  $\text{SiO}_2$  to generate calcium silicates at 800~1700K. The thermodynamic sequence of calcium aluminates reaction with  $\text{SiO}_2$  is firstly  $\text{C}_3\text{A}$ , and then  $\text{C}_{12}\text{A}_7$ ,  $\text{CA}$ ,  $\text{CA}_2$ .

| Reactions   | A, J/mol  | B,<br>J/K.mol | Temperature,<br>K |
|---|-----------|---------------|-------------------|
| $(3)\text{CaO} \cdot 2\text{Al}_2\text{O}_3 + \text{SiO}_2 = 3\text{CaO} \cdot \text{SiO}_2 + 6\text{Al}_2\text{O}_3$                                     | -69807.8  | 70.8          | 298~1800          |
| $(3)\text{CaO} \cdot \text{Al}_2\text{O}_3 + \text{SiO}_2 = 3\text{CaO} \cdot \text{SiO}_2 + 3\text{Al}_2\text{O}_3$                                      | -62678.8  | 42.6          | 298~1800          |

Table 7. The  $\Delta G_T^\theta$  of the reactions  $\text{SiO}_2$  with calcium aluminates(  $\Delta G_T^\theta = A + BT$  , J/mol)

Fig. 8. Relationships between  $\Delta G_T^\theta$  and temperature in SiO<sub>2</sub>-calcium aluminates system

2.8 CaO- Fe<sub>2</sub>O<sub>3</sub> system

Fe<sub>2</sub>O<sub>3</sub> can react with CaO to form CaO·Fe<sub>2</sub>O<sub>3</sub>(CF) and 2CaO·Fe<sub>2</sub>O<sub>3</sub>(C<sub>2</sub>F). When Fe<sub>2</sub>O<sub>3</sub> is used up, the newly formed C<sub>2</sub>F can react with Fe<sub>2</sub>O<sub>3</sub> to form CF. The reaction equations are shown in table 8, and the relationships between  $\Delta G^0$  and temperature are shown in figure 9.

Figure 9 shows that, Fe<sub>2</sub>O<sub>3</sub> reacts with CaO much easily to form C<sub>2</sub>F; CF is not from the reaction of C<sub>2</sub>F and Fe<sub>2</sub>O<sub>3</sub>, but from the directly reaction of Fe<sub>2</sub>O<sub>3</sub> with CaO. When Fe<sub>2</sub>O<sub>3</sub> is excess, C<sub>2</sub>F can react with Fe<sub>2</sub>O<sub>3</sub> to form CF.

| Reactions  | A, J/mol | B, J/K.mol | Temperature, K |
|--|----------|------------|----------------|
| CaO+Fe <sub>2</sub> O <sub>3</sub> =CaO·Fe <sub>2</sub> O <sub>3</sub>                                     | -19179.9 | -11.1      | 298~1489       |
| 2CaO+Fe <sub>2</sub> O <sub>3</sub> =2CaO·Fe <sub>2</sub> O <sub>3</sub>                                   | -40866.7 | -9.3       | 298~1723       |
| 2CaO·Fe <sub>2</sub> O <sub>3</sub> +Fe <sub>2</sub> O <sub>3</sub> =(2)CaO·Fe <sub>2</sub> O <sub>3</sub> | 2340.8   | -12.6      | 298~1489       |

Table 8. The  $\Delta G_T^\theta$  of Fe<sub>2</sub>O<sub>3</sub>-CaO system( $\Delta G_T^\theta = A + BT$ , J/mol)

Fig. 9. Relationships between  $\Delta G_T^\theta$  and temperature in  $\text{Fe}_2\text{O}_3$ -CaO system

2.9  $\text{Al}_2\text{O}_3$ - calcium ferrites system

Figure 1 shows that, the  $\Delta G_T^\theta$  of the reaction of  $\text{Al}_2\text{O}_3$  with  $\text{CaCO}_3$  is more negative than that of  $\text{Fe}_2\text{O}_3$  with  $\text{CaCO}_3$ , therefore, the reaction of  $\text{Fe}_2\text{O}_3$  with  $\text{CaCO}_3$  occurs after the reaction of  $\text{Al}_2\text{O}_3$  with  $\text{CaCO}_3$  under the conditions of excess  $\text{CaCO}_3$ . The new generated calcium ferrites are likely to transform into calcium aluminates when  $\text{CaCO}_3$  is insufficient, the reactions are as followed:

| Reactions   | A, J/mol | B, J/K.mol          | Temperature, K |
|---|----------|---------------------|----------------|
| $(3)\text{CaO}\cdot\text{Fe}_2\text{O}_3 + \text{Al}_2\text{O}_3 = 3\text{CaO}\cdot\text{Al}_2\text{O}_3 + 3\text{Fe}_2\text{O}_3$                                      | 47922.7  | 4.5                 | 298~1489       |
| $(\frac{3}{2})2\text{CaO}\cdot\text{Fe}_2\text{O}_3 + \text{Al}_2\text{O}_3 = 3\text{CaO}\cdot\text{Al}_2\text{O}_3 + \frac{3}{2}\text{Fe}_2\text{O}_3$                 | 49.6     | $-1.2\times10^{-2}$ | 298~1723       |
| $(\frac{12}{7})\text{CaO}\cdot\text{Fe}_2\text{O}_3 + \text{Al}_2\text{O}_3 = (\frac{1}{7})12\text{CaO}\cdot7\text{Al}_2\text{O}_3 + \frac{12}{7}\text{Fe}_2\text{O}_3$ | 32685.1  | -24.5               | 298~1489       |
| $(\frac{6}{7})2\text{CaO}\cdot\text{Fe}_2\text{O}_3 + \text{Al}_2\text{O}_3 = (\frac{1}{7})12\text{CaO}\cdot7\text{Al}_2\text{O}_3 + \frac{6}{7}\text{Fe}_2\text{O}_3$  | 34514.4  | -35.0               | 298~1723       |
| $\text{CaO}\cdot\text{Fe}_2\text{O}_3 + \text{Al}_2\text{O}_3 = \text{CaO}\cdot\text{Al}_2\text{O}_3 + \text{Fe}_2\text{O}_3$   | 3626.6   | -7.5                | 298~1489       |
| $(\frac{1}{2})\text{CaO}\cdot\text{Fe}_2\text{O}_3 + \text{Al}_2\text{O}_3 = (\frac{1}{2})\text{CaO}\cdot2\text{Al}_2\text{O}_3 + \frac{1}{2}\text{Fe}_2\text{O}_3$     | 3215.1   | -8.8                | 298~1489       |
| $(\frac{1}{4})2\text{CaO}\cdot\text{Fe}_2\text{O}_3 + \text{Al}_2\text{O}_3 = (\frac{1}{2})\text{CaO}\cdot2\text{Al}_2\text{O}_3 + \frac{1}{4}\text{Fe}_2\text{O}_3$    | 3168.6   | -11.0               | 298~1723       |
| $(\frac{1}{2})2\text{CaO}\cdot\text{Fe}_2\text{O}_3 + \text{Al}_2\text{O}_3 = \text{CaO}\cdot\text{Al}_2\text{O}_3 + \frac{1}{2}\text{Fe}_2\text{O}_3$                  | 4009.5   | -12.8               | 298~1723       |

Table 9. The  $\Delta G_T^\theta$  of the reaction  $\text{Al}_2\text{O}_3$  with calcium ferrites( $\Delta G_T^\theta = A + BT$ , J/mol)

The relationships between  $\Delta G_T^\theta$  and temperature (T) are shown in figure 10. Figure 10 shows that,  $\text{Al}_2\text{O}_3$  cannot replace the  $\text{Fe}_2\text{O}_3$  in calcium ferrites to generate  $\text{C}_3\text{A}$ , and also cannot replace the  $\text{Fe}_2\text{O}_3$  in  $\text{CaO}\cdot\text{Fe}_2\text{O}_3(\text{CF})$  to generate  $\text{C}_{12}\text{A}_7$ , but it can replace the  $\text{Fe}_2\text{O}_3$  in  $2\text{CaO}\cdot\text{Fe}_2\text{O}_3(\text{C}_2\text{F})$  to generate  $\text{C}_{12}\text{A}_7$  when the temperature is above 1000K, the higher temperature is, the more negative Gibbs free energy is;  $\text{Al}_2\text{O}_3$  can react with CF and  $\text{C}_2\text{F}$  to

form CA or CA<sub>2</sub>, the higher temperature, more negative  $\Delta G_T^\theta$ . Because Fe<sub>2</sub>O<sub>3</sub> reacts with CaO more easily to generate C<sub>2</sub>F (Fig.9), therefore, C<sub>12</sub>A<sub>7</sub> is the reaction product at normal roasting temperature(1073~1673K) under the conditions that CaO is sufficient in batching and the ternary compounds are not considered.

Fig. 10. Relationship between  $\Delta G_T^\theta$  and temperature in Al<sub>2</sub>O<sub>3</sub>- calcium ferrites system

3. Ternary compounds in Al<sub>2</sub>O<sub>3</sub>-CaO-SiO<sub>2</sub>-Fe<sub>2</sub>O<sub>3</sub> system

The ternary compounds formed by CaO, Al<sub>2</sub>O<sub>3</sub> and SiO<sub>2</sub> in roasting process are mainly 2CaO·Al<sub>2</sub>O<sub>3</sub>·SiO<sub>2</sub>(C<sub>2</sub>AS), CaO·Al<sub>2</sub>O<sub>3</sub>·2SiO<sub>2</sub>(CAS<sub>2</sub>), CaO·Al<sub>2</sub>O<sub>3</sub>·SiO<sub>2</sub>(CAS) and 3CaO·Al<sub>2</sub>O<sub>3</sub>·3SiO<sub>2</sub>(C<sub>3</sub>AS<sub>3</sub>). In addition, ternary compound 4CaO·Al<sub>2</sub>O<sub>3</sub>·Fe<sub>2</sub>O<sub>3</sub>(C<sub>4</sub>AF) is formed form CaO, Al<sub>2</sub>O<sub>3</sub> and Fe<sub>2</sub>O<sub>3</sub>. The equations are shown in table 10:

| Reactions   | A, J/mol   | B, J/K.mol | Temperature, K |
|---|------------|------------|----------------|
| CaO ·SiO <sub>2</sub> + CaO ·Al <sub>2</sub> O <sub>3</sub> =2CaO ·Al <sub>2</sub> O <sub>3</sub> ·SiO <sub>2</sub>   | -30809.41  | 0.60       | 298~1600       |
| $\frac{1}{2}$ Al <sub>2</sub> O <sub>3</sub> + $\frac{1}{2}$ CaO + SiO <sub>2</sub> = ( $\frac{1}{2}$ )CaO ·Al <sub>2</sub> O <sub>3</sub> ·2SiO <sub>2</sub> | -47997.55  | -7.34      | 298~1826       |
| Al <sub>2</sub> O <sub>3</sub> + 2CaO + SiO <sub>2</sub> =2CaO ·Al <sub>2</sub> O <sub>3</sub> ·SiO <sub>2</sub>  | -50305.83  | -9.33      | 298~1600       |
| Al <sub>2</sub> O <sub>3</sub> + CaO + SiO <sub>2</sub> =CaO ·Al <sub>2</sub> O <sub>3</sub> ·SiO <sub>2</sub>  | -72975.54  | -9.49      | 298~1700       |
| $\frac{1}{3}$ Al <sub>2</sub> O <sub>3</sub> + CaO + SiO <sub>2</sub> = ( $\frac{1}{3}$ )3CaO ·Al <sub>2</sub> O <sub>3</sub> ·3SiO <sub>2</sub>              | -112354.51 | 20.86      | 298~1700       |
| 4CaO +Al <sub>2</sub> O <sub>3</sub> + Fe <sub>2</sub> O <sub>3</sub> =4CaO ·Al <sub>2</sub> O <sub>3</sub> ·Fe <sub>2</sub> O <sub>3</sub>                   | -66826.92  | -62.5      | 298~2000       |
| Al <sub>2</sub> O <sub>3</sub> + 2CaO + SiO <sub>2</sub> =2CaO ·Al <sub>2</sub> O <sub>3</sub> ·SiO <sub>2</sub><br>(cacoclasite)                             | -136733.59 | -17.59     | 298~1863       |

Table 10. The  $\Delta G_T^\theta$  of forming ternary compounds ( $\Delta G_T^\theta = A + BT$  , J/mol)

The relationships between  $\Delta G_T^\theta$  and temperature (T) are shown in figure 11. Figure 11 shows that, except for  $C_3AS_3$ (Hessonite), all the  $\Delta G_T^\theta$  of the reactions get more negative with the temperature increasing; the thermodynamic order of generating ternary compounds at sintering temperature of 1473K is:  $C_2AS$ (cacoclasite),  $C_4AF$ ,  $CAS$ ,  $C_3AS_3$ ,  $C_2AS$ ,  $CAS_2$ .

$C_2AS$  may also be formed by the reaction of CA and CS, the curve is presented in figure 11.

Figure 11 shows that, the  $\Delta G_T^\theta$  of reaction  $(Al_2O_3+CaO+SiO_2)$  is lower than that of reaction of CA and CS to generate  $C_2AS$ . So  $C_2AS$  does not form from the binary compounds CA and CS, but from the direct combination among  $Al_2O_3$ , CaO,  $SiO_2$ . Qiusheng Zhou thinks that,  $C_4AF$  is not formed by mutual reaction of calcium ferrites and sodium aluminates, but from the direct reaction of CaO,  $Al_2O_3$  and  $Fe_2O_3$ . Thermodynamic analysis of figure 1~figure11 shows that, reactions of  $Al_2O_3$ ,  $Fe_2O_3$ ,  $SiO_2$  and CaO are much easier to form  $C_2AS$  and  $C_4AF$ , as shown in figure 12.

Fig. 11. Relationships between  $\Delta G_T^\theta$  of ternary compounds and temperature

Figure 12 shows that, in thermodynamics,  $C_2AS$  and  $C_4AF$  are firstly formed when  $Al_2O_3$ ,  $Fe_2O_3$ ,  $SiO_2$  and CaO coexist, and then calcium silicates, calcium aluminates and calcium ferrites are generated.

#### 4. Summary

1) When  $Al_2O_3$  and  $Fe_2O_3$  simultaneously react with CaO, calcium silicates are firstly formed, and then calcium ferrites. In thermodynamics, when one mole  $Al_2O_3$  reacts with CaO, the sequence of generating calcium aluminates are  $12CaO \cdot 7Al_2O_3$ ,  $3CaO \cdot Al_2O_3$ ,  $CaO \cdot Al_2O_3$ ,  $CaO \cdot 2Al_2O_3$ . When CaO is insufficient, redundant  $Al_2O_3$  may promote the newly generated high calcium-to-aluminum ratio calcium aluminates to transform to lower calcium-to-aluminum ratio calcium aluminates.  $Fe_2O_3$  reacts with CaO easily to form  $2CaO \cdot Fe_2O_3$ , and  $CaO \cdot Fe_2O_3$  is not from the reaction of  $2CaO \cdot Fe_2O_3$  and  $Fe_2O_3$  but from the directly combination of  $Fe_2O_3$  with CaO.  $Al_2O_3$  cannot replace the  $Fe_2O_3$  in calcium ferrites to generate  $3CaO \cdot Al_2O_3$ , and also cannot replace the  $Fe_2O_3$  in  $CaO \cdot Fe_2O_3$  to generate  $12CaO \cdot 7Al_2O_3$ , but can replace the  $Fe_2O_3$  in  $2CaO \cdot Fe_2O_3$  to generate  $12CaO \cdot 7Al_2O_3$  when the temperature is above 1000K;  $Al_2O_3$  can react with calcium ferrites to form  $CaO \cdot Al_2O_3$  or  $CaO \cdot 2Al_2O_3$ .

Fig. 12. Relationships between  $\Delta G_T^0$  and temperature in Al<sub>2</sub>O<sub>3</sub>-CaO-SiO<sub>2</sub>-Fe<sub>2</sub>O<sub>3</sub> system

- 2) One mole SiO<sub>2</sub> reacts with Al<sub>2</sub>O<sub>3</sub> much easily to generate 3Al<sub>2</sub>O<sub>3</sub>·2SiO<sub>2</sub>, Fe<sub>2</sub>O<sub>3</sub> can not react with SiO<sub>2</sub> in the roasting process in the air. Al<sub>2</sub>O<sub>3</sub> can not directly react with Fe<sub>2</sub>O<sub>3</sub>, but can react with wustite (FeO) to form FeO·Al<sub>2</sub>O<sub>3</sub>.
- 3) In thermodynamics, the sequence of one mole SiO<sub>2</sub> reacts with CaO to form calcium silicates is 2CaO·SiO<sub>2</sub>, 3CaO·SiO<sub>2</sub>, 3CaO·2SiO<sub>2</sub> and CaO·SiO<sub>2</sub>. Calcium aluminates can react with SiO<sub>2</sub> to transform to calcium silicates and Al<sub>2</sub>O<sub>3</sub>. CaO·2Al<sub>2</sub>O<sub>3</sub> can not transform to 3CaO·SiO<sub>2</sub> when the roasting temperature is above 900K; when the temperature is above

1500K,  $3\text{CaO} \cdot \text{Al}_2\text{O}_3$  can not transform to  $3\text{CaO} \cdot \text{SiO}_2$ ; but the other calcium aluminates all can all react with  $\text{SiO}_2$  to generate calcium silicates at 800~1700K.

4) Reactions among  $\text{Al}_2\text{O}_3$ ,  $\text{Fe}_2\text{O}_3$ ,  $\text{SiO}_2$  and  $\text{CaO}$  easily form  $2\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{SiO}_2$  and  $4\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{Fe}_2\text{O}_3$ .  $2\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{SiO}_2$  does not form from the reaction of  $\text{CaO} \cdot \text{Al}_2\text{O}_3$  and  $\text{CaO} \cdot \text{SiO}_2$ , but from the direct reaction among  $\text{Al}_2\text{O}_3$ ,  $\text{CaO}$ ,  $\text{SiO}_2$ . And  $4\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{Fe}_2\text{O}_3$  is also not formed via mutual reaction of calcium ferrites and sodium aluminates, but from the direct reaction of  $\text{CaO}$ ,  $\text{Al}_2\text{O}_3$  and  $\text{Fe}_2\text{O}_3$ . In thermodynamics, when  $\text{Al}_2\text{O}_3$ ,  $\text{Fe}_2\text{O}_3$ ,  $\text{SiO}_2$  and  $\text{CaO}$  coexist,  $2\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{SiO}_2$  and  $4\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{Fe}_2\text{O}_3$  are firstly formed, and then calcium silicates, calcium aluminates and calcium ferrites.

## 5. Symbols used

Thermodynamic temperature: T, K

Thermal unit: J

Amount of substance: mole

Standard Gibbs free energy:  $\Delta G_T^\theta$ , J

## **Thermodynamics - Interaction Studies - Solids, Liquids and Gases**

Edited by Dr. Juan Carlos Moreno Piraján

ISBN 978-953-307-563-1

Hard cover, 918 pages

**Publisher** InTech

**Published online** 02, November, 2011

**Published in print edition** November, 2011

Thermodynamics is one of the most exciting branches of physical chemistry which has greatly contributed to the modern science. Being concentrated on a wide range of applications of thermodynamics, this book gathers a series of contributions by the finest scientists in the world, gathered in an orderly manner. It can be used in post-graduate courses for students and as a reference book, as it is written in a language pleasing to the reader. It can also serve as a reference material for researchers to whom the thermodynamics is one of the area of interest.

### **How to reference**

In order to correctly reference this scholarly work, feel free to copy and paste the following:

Zhongping Zhu, Tao Jiang, Guanghui Li, Yufeng Guo and Yongbin Yang (2011). Thermodynamics of Reactions Among  $\text{Al}_2\text{O}_3$ ,  $\text{CaO}$ ,  $\text{SiO}_2$  and  $\text{Fe}_2\text{O}_3$  During Roasting Processes, Thermodynamics - Interaction Studies - Solids, Liquids and Gases, Dr. Juan Carlos Moreno Piraján (Ed.), ISBN: 978-953-307-563-1, InTech, Available from: <http://www.intechopen.com/books/thermodynamics-interaction-studies-solids-liquids-and-gases/thermodynamics-of-reactions-among-al2o3-caO-sio2-and-fe2o3-during-roasting-processes>
